altairsim — altairsim machines

2026-10-14 · d766c3c

Example machines for **altairsim**, a simulator of the MITS Altair 8800 and the S-100 boards and computers around it. Every machine here is written for that simulator and runs on it; install altairsim first, and `altairsim` must be on your `PATH`.

Each machine is a directory under `examples/` holding a `.toml` machine file, the disk, tape or ROM images it boots, and a README that says what you will see. Copy a directory anywhere and it still runs. `examples/README.md` lists every machine and what it is.

```
cd examples/hdsk
altairsim hdsk.toml
```

What is here

`examples/`	The machines, one directory each, with a `README.md` and `README.pdf`. Each directory also holds a `<dir>.zip` of all its files: download that one file, or the individual files, not both.
`tests/`	One test per machine. Each boots the machine in a scratch copy and checks what reaches the console. Run them with `tests/run.sh`.
`tools/`	The scripts that build the README PDFs and the machine zips.
`.claude/skills/`	Instructions for Claude Code: `open-pr` (open a PR, watch CI, test the zips), `readme-pdf` (build the README PDFs) and `simplified-english` (the writing style for the READMEs). The `altairsim-*` skills come from the altairsim repository. Copy them by hand. This repository does not track them.
`.github/workflows/`	CI. It rebuilds the PDFs and zips for what changed and commits them to the pull request.

The PDFs and zips are generated; edit the Markdown and the machine files, never those.
